## 1. Introduction to myDAQ

NI myDAQ is a simple and intuitive DAQ device from National Instruments. NI myDAQ have Inputs (AI), Analog Outputs (AO), Digital Inputs (DI) and Digital Outputs (DO).

In addition to traditional I/O, the myDAQ have a built-in **Digital Multimeter**. The myDAQ can be used as a **Power Supply**. Using the built-in software the myDAQ can also be used as an **Oscilloscope** and **Function Generator**.

When you plug in the device in the USB connection on your PC, the following will pop-up automatically (NI ELVISmx Instrument Launcher):

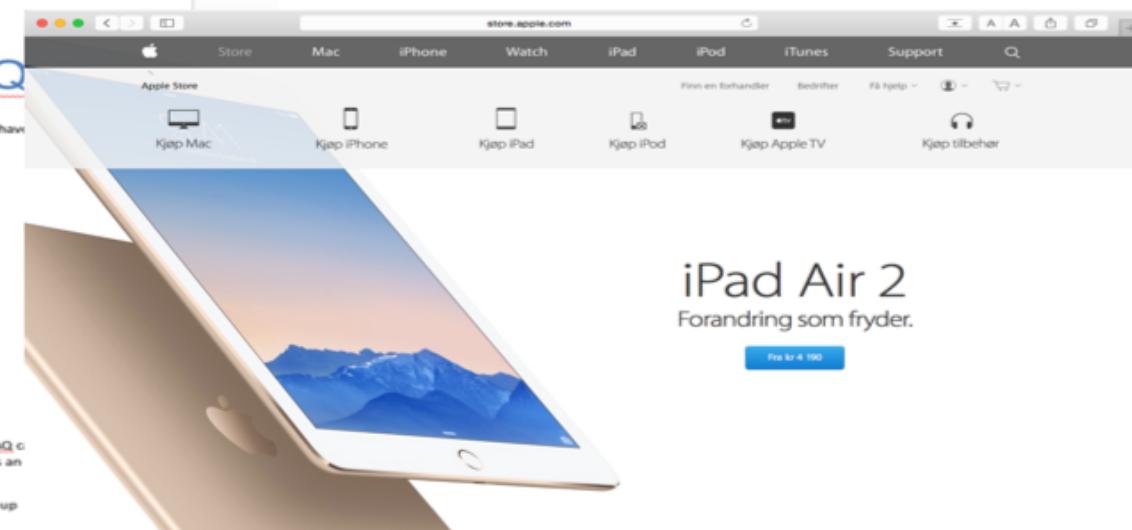

Note! You need to install the NI ELVISmx driver software first

If not, you find it in the National Instruments folder:

## Industrial IT and Automation

Published 2018.01.19 - Hans-Petter Halvorsen - Updated 2018.02.02 - Hans-Petter Halvorsen

Industrial IT Automation Programming

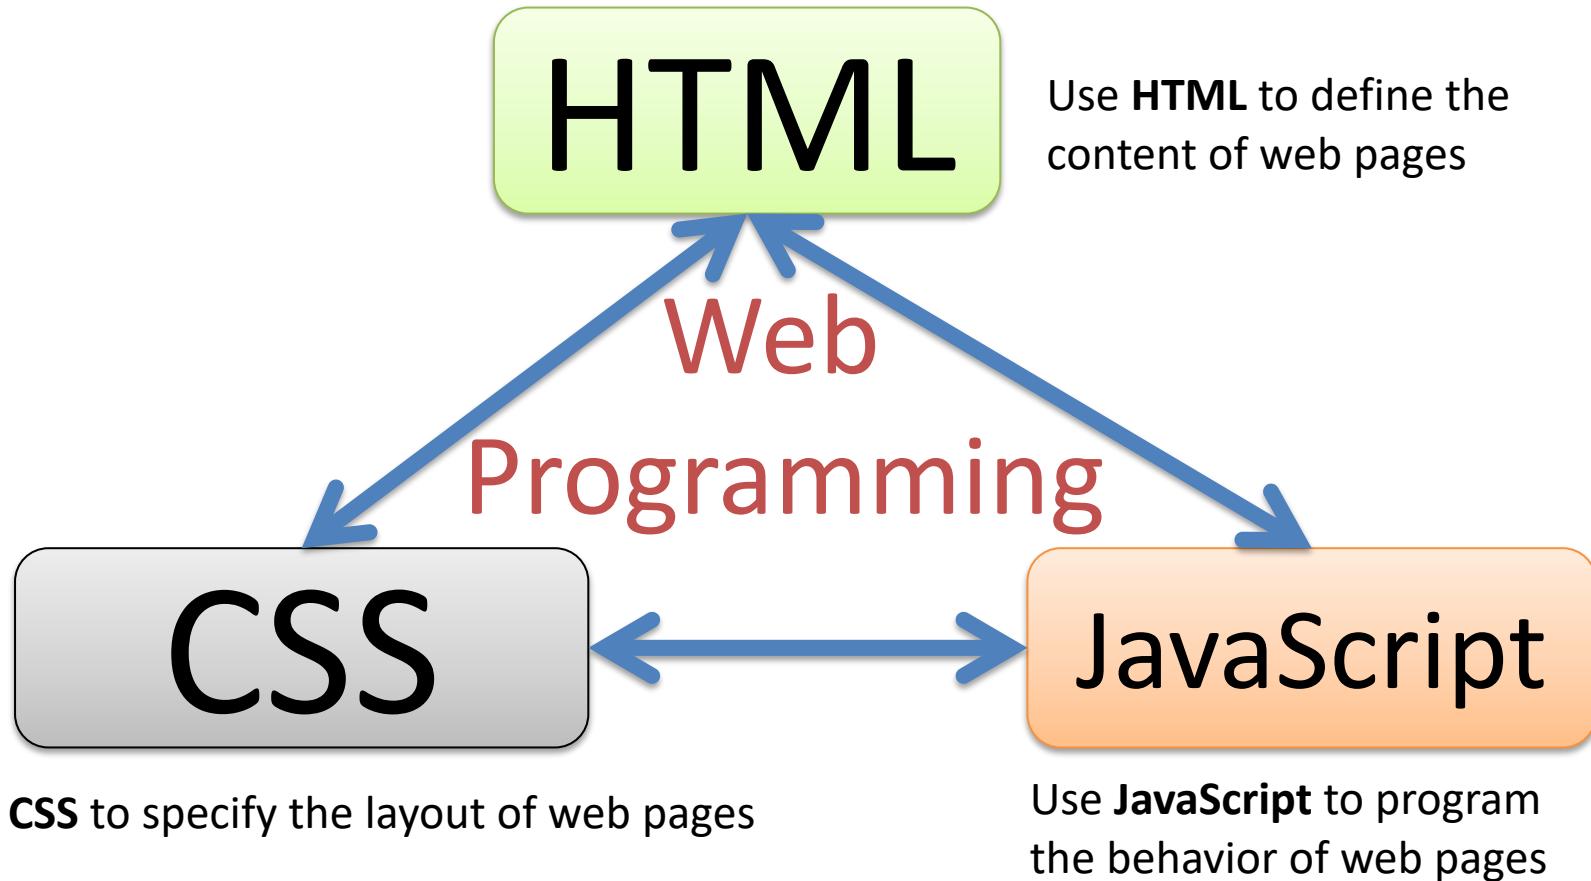

Industrial IT and Automation are important fields today and will be even more important in the future with the new age of digitalization, Internet of Things, data security and the industrial and environmental challenges of tomorrow. Industrial IT and Automation are needed in all kind of industries today and in the future. Industrial IT and Automation are knowledge for the future. The future is now - Let's change it together!

Do you want to study [Industrial IT and Automation](#)?

# The Web Programming Triangle

# Web Programming

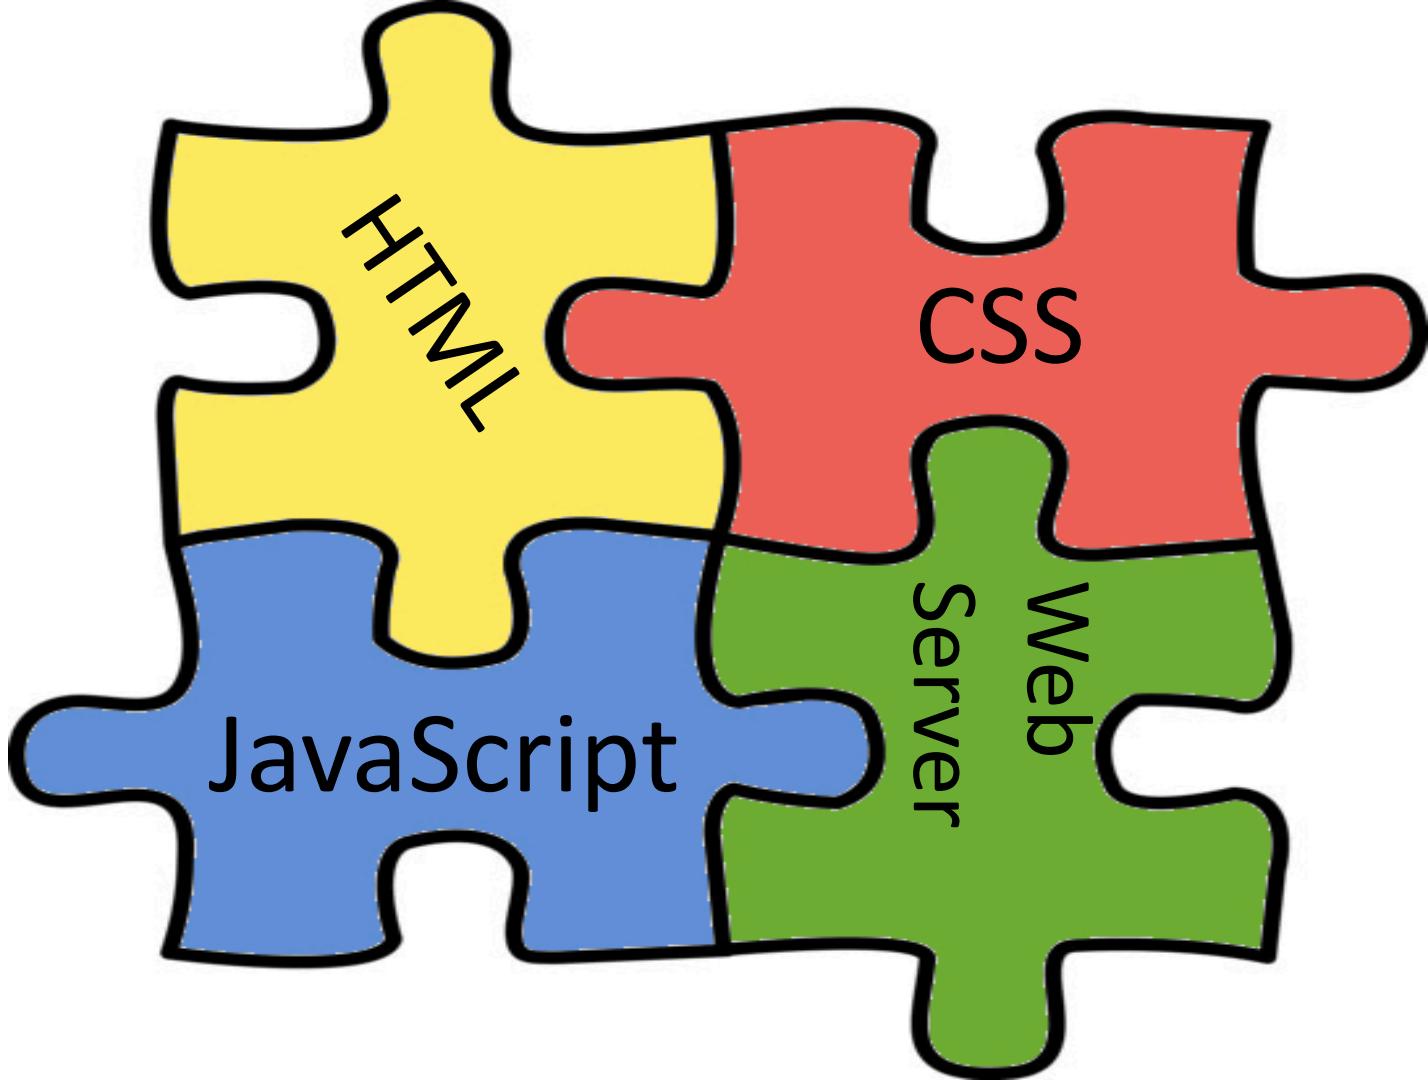

# Basic Web Programming

- HTML
- CSS
- JavaScript

For more Dynamic Web Programming we use, e.g.,

- ASP.NET
- SQL
- AJAX
- PHP
- etc. (But these are not part of this Tutorial)

These are typically used together with a Database System, such as MySQL, SQL Server, etc.

# Web Architecture

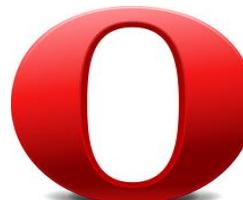

Edge

Chrome

Firefox

Opera

Safari

Client

Web Browser

HTML

CSS

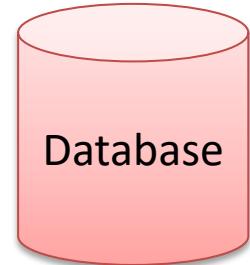

JavaScript

Server-side

ASP.NET

PHP

Web Server

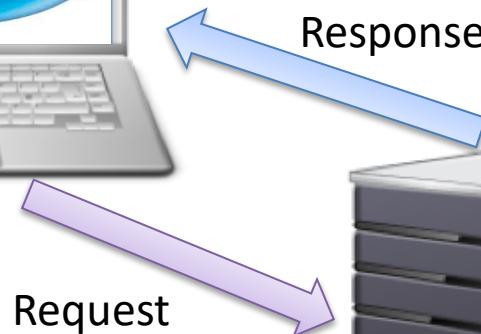

Database

# Client-Server Example

**Client**

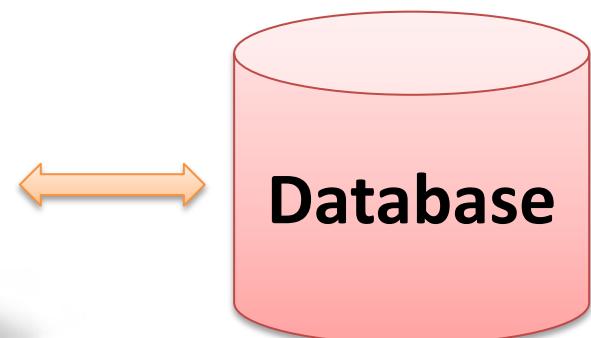

**Web Browser**

The Web Pages are stored on the Web Server and sent to the client on request from the Web Browser

**Web Server**

**Database**

Internet Information Services (IIS), Apache, etc.

# Web Platform

The Web Browser creates the visual web page you see in the browser based on

```
<!DOCTYPE html>
<html>
<body>

<h1>My First Heading</h1>

<p>My first paragraph.</p>

</body>
</html>
```

the HTML code

**My First Heading**

My first paragraph.

HTML, CSS, JavaScript

Client-side

The code runs on the server and converted to  
HTML before sending to client (Web Browser)

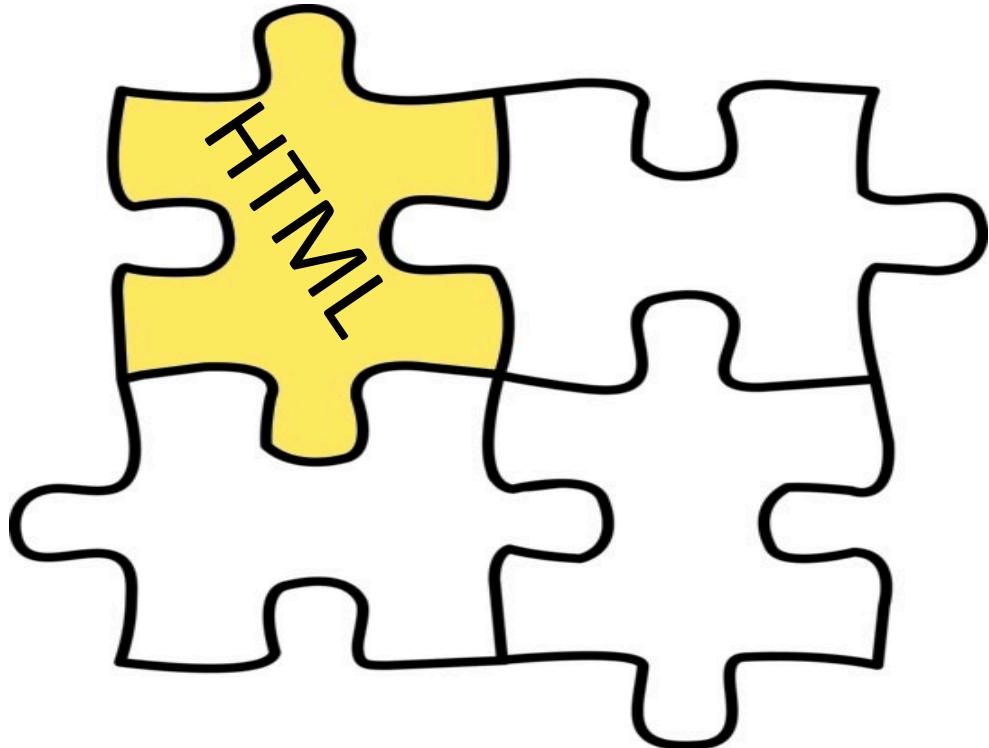

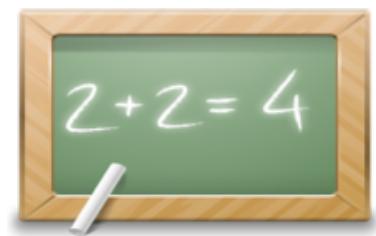

ASP.NET, PHP, ...

Web Page (HTML)

Web Server

Server-side

Internet Information Services (IIS), Apache, etc.

Hans-Petter Halvorsen, M.Sc.

# HTML

- HyperText Markup Language (HTML)
- The Visual Appearance of a Web Site
- “Web Browser Language”: All Web Browser understand HTML
- HTML 5 is the latest
- Maintained by W3C - World Wide Web Consortium

```
<!DOCTYPE html>
<html>
  <head>
    <meta charset="UTF-8">
    <title>Title of the document</title>
  </head>

  <body>
    Content of the document.....
  </body>

</html>
```

```
<!DOCTYPE html>
<html>
<body>
<h1>My First Heading</h1>
<p>My first paragraph.</p>
</body>
</html>
```

HTML Code

HTML

Web Browser

# HTML Page Structure

```
<html>
  <body>
    <h1>This is a heading</h1>
    <p>This is a paragraph.</p>
    <p>This is another paragraph.</p>
  </body>
</html>
```

!DOCTYPE html  
<html>  
<body>  
 <h1>This is a heading</h1>  
 <p>This is a paragraph.</p>  
 <p>This is another  
 paragraph.</p>  
</body>  
</html>

# HTML Editors

Professional HTML editors:

- Adobe Dreamweaver
- CoffeeCup HTML Editor
- ...

These are WYSIWYG Editors where you can see the resulting Web page instantly

For the simple examples in this Tutorial you may only need Notepad (Windows) orTextEdit (Mac)

Another Editor is **Visual Studio Code**

# My First HTML Web Page

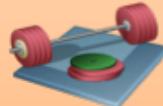

<tagname>content</tagname>

```
<!DOCTYPE html>
<html>
<body>

<h1>My First Heading</h1>

<p>My first paragraph.</p>

</body>
</html>
```

- The DOCTYPE declaration defines the document type
- The text between `<html>` and `</html>` describes the web document
- The text between `<body>` and `</body>` describes the visible page content
- The text between `<h1>` and `</h1>` describes a heading
- The text between `<p>` and `</p>` describes a paragraph

Exercise: Create this HTML Code in e.g., NotePad and Save the File as .htm.  
Then Open the File in a Web Browser (just double-click on the file).

# Images

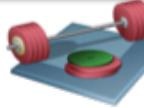

# Hyperlinks

```
<!DOCTYPE html>
<html>
<body>

<h1>This is a heading</h1>

<a href="http://www.google.com">This is a link to Google</a>

</body>
</html>
```

Exercises: Create these Examples

```
<!DOCTYPE html>
<html>
<body>

<h1>This is a heading</h1>

</body>
</html>
```

# HTML Tags

Hyperlink:

```
<a href="http://www.google.com">This is a link to Google</a>
```

Bold Text:

```
<b>This is my Text</b> or <strong>
```

Headers:

```
<h1>This is my Header</h1>  
<h2>This is my Header</h2>  
<h3>This is my Header</h3>
```

Title:

```
<title>This is my Title</title>
```

Image:

```

```

Paragraph:

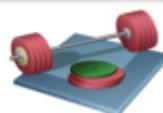

```
<p>My first paragraph.</p>
```

Line Break:

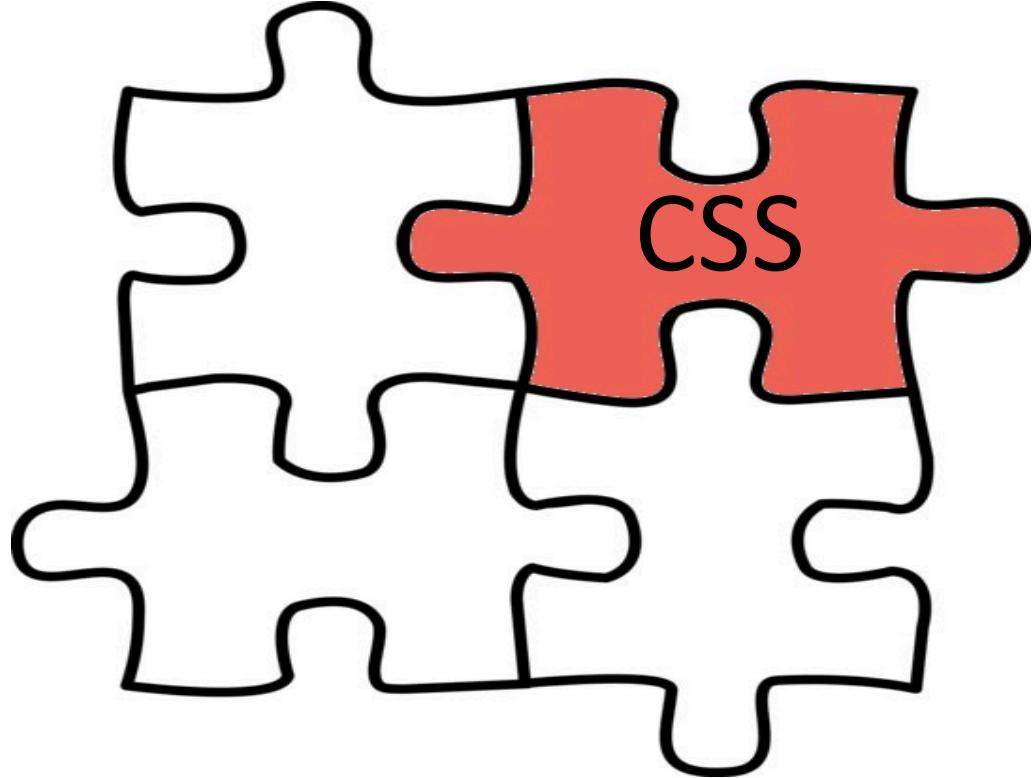

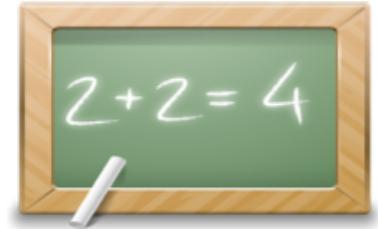

```
This is my Text  
<br>  
This is also my Text
```

Comments:

```
<!-- Write your comments here -->
```

Exercises: Try these Examples

Hans-Petter Halvorsen, M.Sc.

# CSS

- CSS – Cascading Style Sheets
- Styles define **how to display** HTML elements
- CSS is used to control the style and layout of multiple Web pages all at once

```
body {  
    background-color: #d0e4fe;  
}  
h1 {  
    color: orange;  
    text-align: center;  
}  
p {  
    font-family: "Times New Roman";  
    font-size: 20px;  
}
```

# Why CSS is needed

- HTML was never intended to contain tags for formatting a document.
- HTML was intended to define the content of a document, like:
  - <h1>This is a heading</h1>
  - <p>This is a paragraph.</p>
- When tags like <font>, and color attributes were added to the HTML 3.2 specification, it started a nightmare for web developers. Development of large web sites, where fonts and color information were added to every single page, became a long and expensive process.
- To solve this problem, the World Wide Web Consortium (W3C) created CSS.
- In HTML 4.0, all formatting could be removed from the HTML document, and stored in a separate CSS file.
- All browsers support CSS today.

# HTML + CSS Example

```
<!DOCTYPE html>
<html>
<head>
<style>
body {
    background-color: #d0e4fe;
}

h1 {
    color: orange;
    text-align: center;
}

p {
    font-family: "Times New Roman";
    font-size: 20px;
}
</style>
</head>
<body>

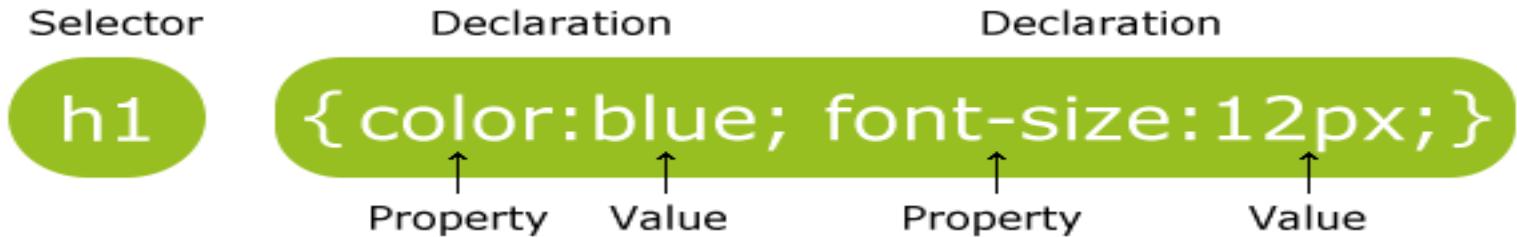

<h1>My First CSS Example</h1>
<p>This is a paragraph.</p>

</body>
</html>
```

Exercises: Create this Code in e.g., NotePad or Visual Studio Code and Save the File as .html. Then Open the File in a Web Browser (just double-click on the file). Change color, etc. and see what happens.

# CSS Syntax

A CSS declaration always ends with a semicolon, and declaration groups are surrounded by curly braces, e.g.:

```
p {color:red;text-align:center;}
```

# CSS Classes

```
.center {  
    text-align: center;  
    color: red;  
}
```

```
} p.center {  
    text-align: center;  
    color: red;  
}
```

```
<!DOCTYPE html>  
<html>  
<head>  
<style>  
.center {  
    text-align: center;  
    color: red;  
}  
</style>  
</head>  
<body>  
  
<h1 class="center">My Heading</h1>  
<p class="center">My Paragraph</p>  
  
</body>  
</html>
```

```
<!DOCTYPE html>  
<html>  
<head>  
<style>  
p.center {  
    text-align: center;  
    color: red;  
}  
</style>  
</head>  
<body>  
  
<h1 class="center">My Heading</h1>  
<p class="center">My Paragraph</p>  
  
</body>  
</html>
```

Exercises: Try these Examples

# Three Ways to Insert CSS

There are three ways of inserting a style sheet:

- **External style sheet** (Recommended!!)
  - An external style sheet is ideal when the style is applied to many pages. With an external style sheet, you can change the look of an entire Web site by changing just one file.
  - An external style sheet can be written in any text editor. The file should not contain any html tags.
  - The style sheet file must be saved with a .css extension
- **Internal style sheet**
  - An internal style sheet should be used when a single document has a unique style.
  - You define internal styles in the head section of an HTML page, inside the <style> tag
- **Inline style**
  - An inline style loses many of the advantages of a style sheet (by mixing content with presentation). Use this method sparingly!

# Internal Style Sheet Example

You define internal styles in the head section of an HTML page, inside the `<style>` tag, like this:

```
<head>
<style>
body {
    background-color: linen;
}
h1 {
    color: maroon;
    margin-left: 40px;
}
</style>
</head>
```

Exercise: Try this Example

```
<!DOCTYPE html>
<html>
<head>
<style>
body {
    background-color: linen;
}
h1 {
    color: maroon;
    margin-left: 40px;
}
</style>
</head>
<body>

<h1>This is a heading</h1>
<p>This is a paragraph.</p>

</body>
</html>
```

# External Style Sheet Example

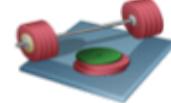

Each HTML page must include a link to the style sheet with the <link> tag. The <link> tag goes inside the head section:

```
<head>
<link rel="stylesheet" type="text/css" href="myStyle.css">
</head>
```

An example of a style sheet file called “myStyle.css”, is shown below:

```
body {
    background-color: lightblue;
}

h1 {
    color: navy;
    margin-left: 20px;
}
```

Exercise: Try this Example

# CSS Properties

## Text Color

```
body {  
    color: blue;  
}  
  
h1 {  
    color: #00ff00;  
}  
  
h2 {  
    color: rgb(255,0,0);  
}
```

## Text Alignment

```
h1 {  
    text-align: center;  
}  
  
p.date {  
    text-align: right;  
}  
  
p.main {  
    text-align: justify;  
}
```

## Text Font

```
p {  
    font-family: "Times New Roman", Times, serif;  
}
```

Exercise: Create a Style Sheet (.CSS) and a HTML page where you use these Properties

## Background Color

```
body {  
    background-color: lightblue;  
}
```

## Text Size

```
h1 {  
    font-size: 40px;  
}
```

```
h2 {  
    font-size: 30px;  
}
```

```
p {  
    font-size: 14px;  
}
```

# CSS Example

[http://www.w3schools.com/css/demo\\_default.htm](http://www.w3schools.com/css/demo_default.htm)

## Welcome to My Homepage

Use the menu to select different Stylesheets

Stylesheet 1

Stylesheet 2

Stylesheet 3

Stylesheet 4

No Stylesheet

## Same Page Different Stylesheets

This is a demonstration of how different stylesheets can change the layout of your HTML page. You can change the layout of this page by selecting different stylesheets in the menu, or by selecting one of the following links:

[Stylesheet1](#), [Stylesheet2](#), [Stylesheet3](#), [Stylesheet4](#).

### No Styles

This page uses DIV elements to group different sections of the HTML page. Click [here](#) to see how the page looks like with no stylesheet:

[No Stylesheet](#).

### View Stylesheets

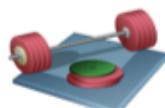

The stylesheets uses CSS syntax to layout the HTML page. Take a look at the stylesheets used in this demonstration:

[Stylesheet1](#), [Stylesheet2](#), [Stylesheet3](#), [Stylesheet4](#).

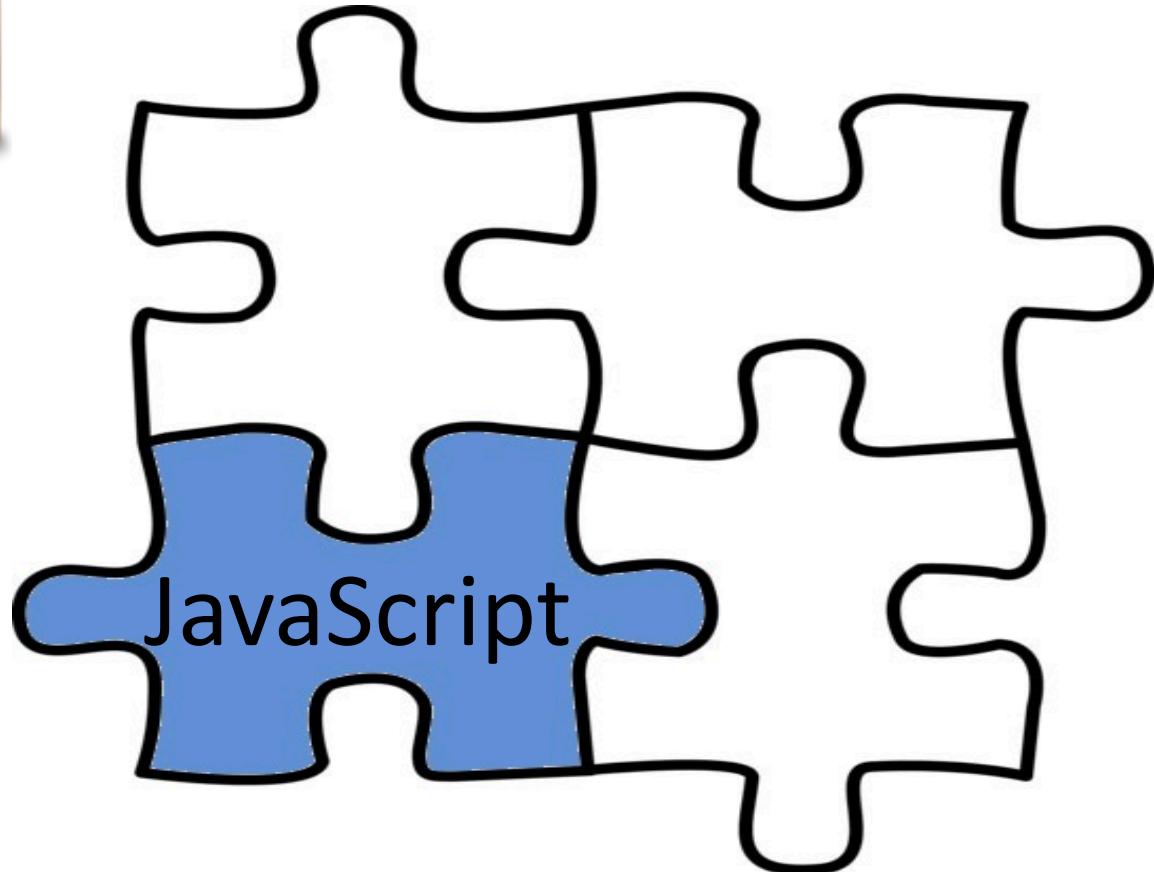

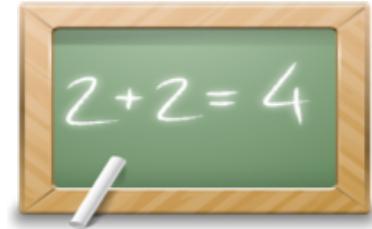

### Side-Bar

Lore ipsum dolor sit amet, consectetuer adipiscing elit, sed diam nonummy nibh euismod tincidunt ut laoreet dolore magna aliquam erat volutpat.

Ut wisi enim ad minim veniam, quis nostrud exerci tation ullamcorper suscipit lobortis nisl ut aliquip ex ea commodo consequat. Duis autem vel eum iriure dolor in hendrerit in vulputate velit esse molestie consequat, vel illum dolore eu feugiat nulla facilisis at vero eros et accumsan et iusto odio dignissim qui blandit praesent luptatum zzril delenit augue duis dolore te feugait nulla facilisi.

Exercise: Open this Example and see how different styles totally changes the display and layout of a HTML page

Hans-Petter Halvorsen, M.Sc.

# JavaScript

- JavaScript is the programming language of the Web.
- All modern HTML pages are using JavaScript.
- JavaScript is the default scripting language in all modern browsers, and in HTML5.
- JavaScript is probably the most popular programming language in the world.
- It is the language for HTML, for the Web, for computers, servers, laptops, tablets, smart phones, and more.
- JavaScript can Change HTML Elements! – which makes it very powerful!

# Why JavaScript?

JavaScript is one of **3 languages** all web developers **must** learn:

- 1. **HTML** to define the content of web pages
- 2. **CSS** to specify the layout of web pages
- 3. **JavaScript** to program the behavior of web pages

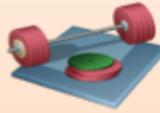

This tutorial is about JavaScript, and how JavaScript works with HTML and CSS.

# JavaScript vs. Java

- JavaScript and Java are different languages, both in concept and design.
- JavaScript was invented by Brendan Eich, to be used in Netscape (a no longer existing browser) in 1995, and was adopted by the ECMA standard association in 1997.

# JavaScript Example

Students: Try this Example

```
<!DOCTYPE html>
<html>
<body>
<h1>My First JavaScript</h1>

<p>JavaScript can change the content of an HTML element:</p>

<button type="button" onclick="myFunction()">Click Me!</button>

<p id="demo">This is a demonstration.</p>

<script>
function myFunction() {
    document.getElementById("demo").innerHTML = "Hello JavaScript!";
}
</script>

</body>
</html>
```

## My First JavaScript

JavaScript can change the content of an HTML element:

[Click Me!](#)

Hello JavaScript!

# JavaScript Example 2

```
<!DOCTYPE html>
<html>
<body>

<p>Please input a number between 1 and 10:</p>

<input id="numb" type="number">

<button type="button" onclick="myFunction()">Submit</button>

<p id="demo"></p>

<script>
function myFunction() {
    var x, text;

    // Get the value of input field with id="numb"
    x = document.getElementById("numb").value;

    // If x is Not a Number or less than one or greater than 10

    if (isNaN(x) || x < 1 || x > 10) {
        text = "Input not valid";
    } else {
        text = "Input OK";
    }
    document.getElementById("demo").innerHTML = text;
}
</script>

</body>
</html>
```

Please input a number between 1 and 10:

Input not valid

Exercise: Try this Example

# JavaScript Comments

```
// Change heading:  
document.getElementById("myH").innerHTML = "My First Page";  
// Change paragraph:  
document.getElementById("myP").innerHTML = "My first paragraph.";
```

```
var x = 5;      // Declare x, give it the value of 5  
var y = x + 2; // Declare y, give it the value of x + 2
```

```
/*  
The code below will change the heading with id = "myH" and the paragraph with id = "myP" in my web page:  
*/  
document.getElementById("myH").innerHTML = "My First Page";  
document.getElementById("myP").innerHTML = "My first paragraph.;"
```

## Using Comments to Prevent Execution:

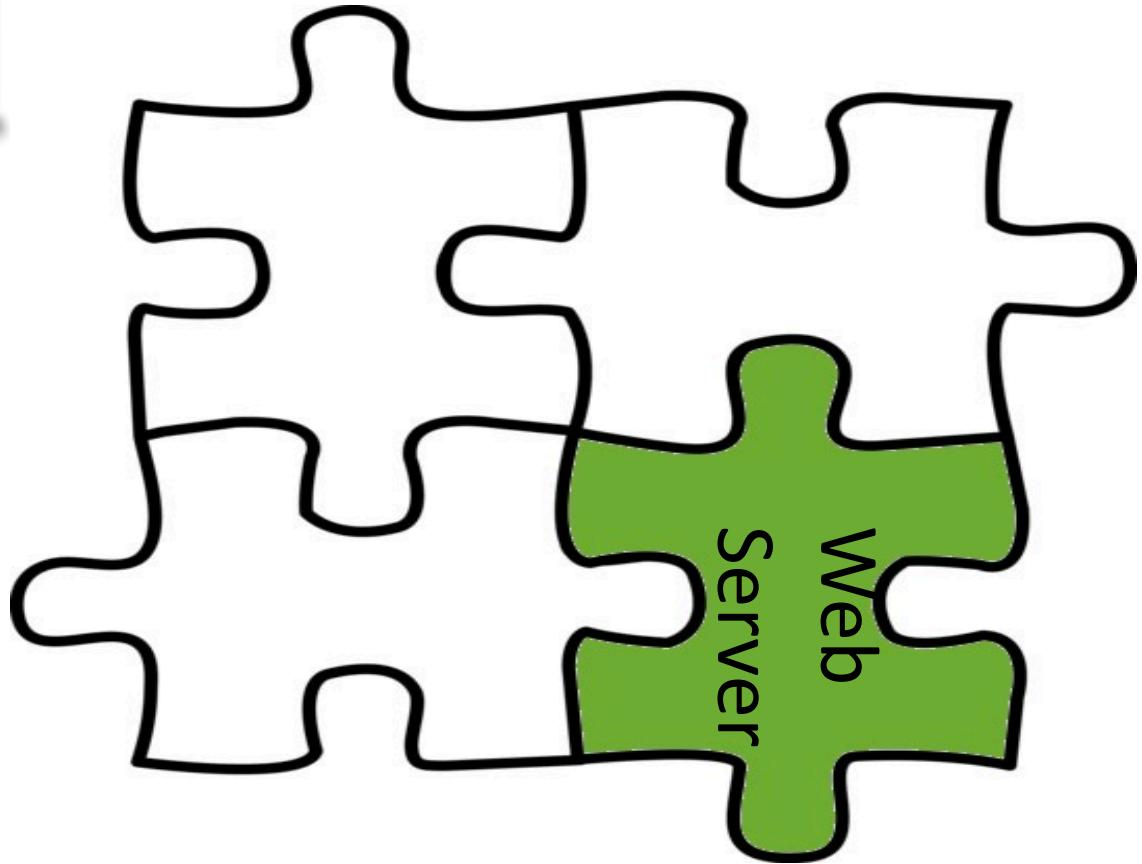

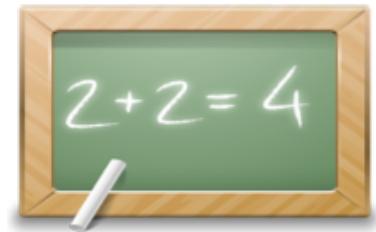

```
//document.getElementById("myH").innerHTML = "My First Page";  
document.getElementById("myP").innerHTML = "My first paragraph.;"
```

```
/*  
document.getElementById("myH").innerHTML = "My First Page";  
document.getElementById("myP").innerHTML = "My first paragraph.;"  
*/
```

# JavaScript Placement

- You can place any number of scripts in an HTML document. Scripts can be placed in the <body>, or in the <head> section of an HTML page, or in both.
- It is a good idea to place scripts at the bottom of the <body> element. This improves page load, because HTML loading is not blocked by scripts loading.
- Scripts can also be placed in external files. External scripts are practical when the same code is used in many different web pages. JavaScript files have the file extension .js.

Hans-Petter Halvorsen, M.Sc.

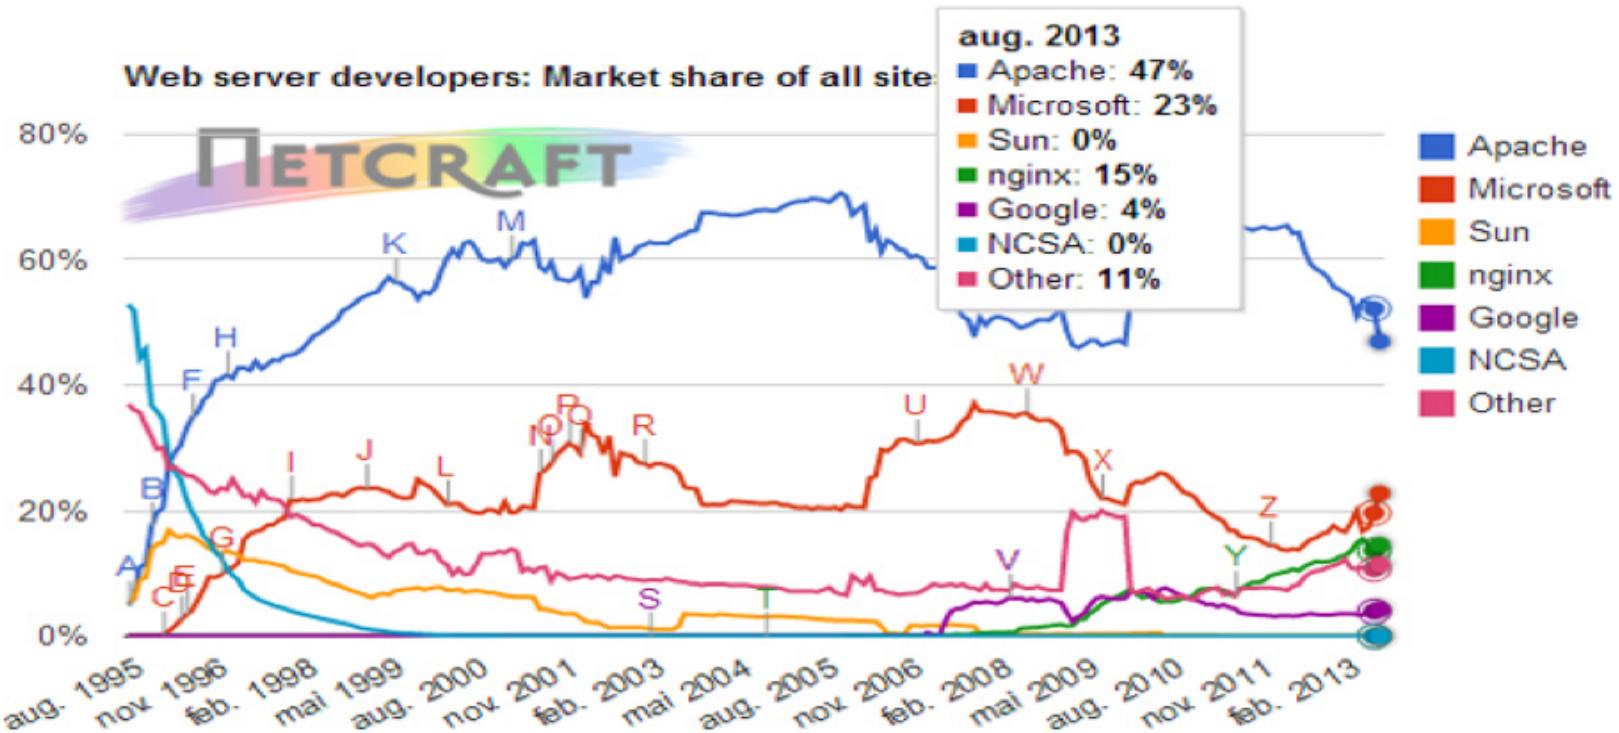

# Web Server

The term web server can refer to either the hardware (the computer) or the software (the computer application) that helps to deliver web content that can be accessed through the Internet.

The most common use of web servers is to host websites, but there are other uses such as gaming, data storage or running enterprise applications.

- **IIS - Internet Information Services**
  - Microsoft Windows
- **Apache Web Server**
  - Open Source
  - Cross-platform: UNIX, Linux, OS X, Windows, ...
- **Nginx** (pronounced "engine x") - Has become very popular lately
- **GWS (Google Web Server)**
- ...

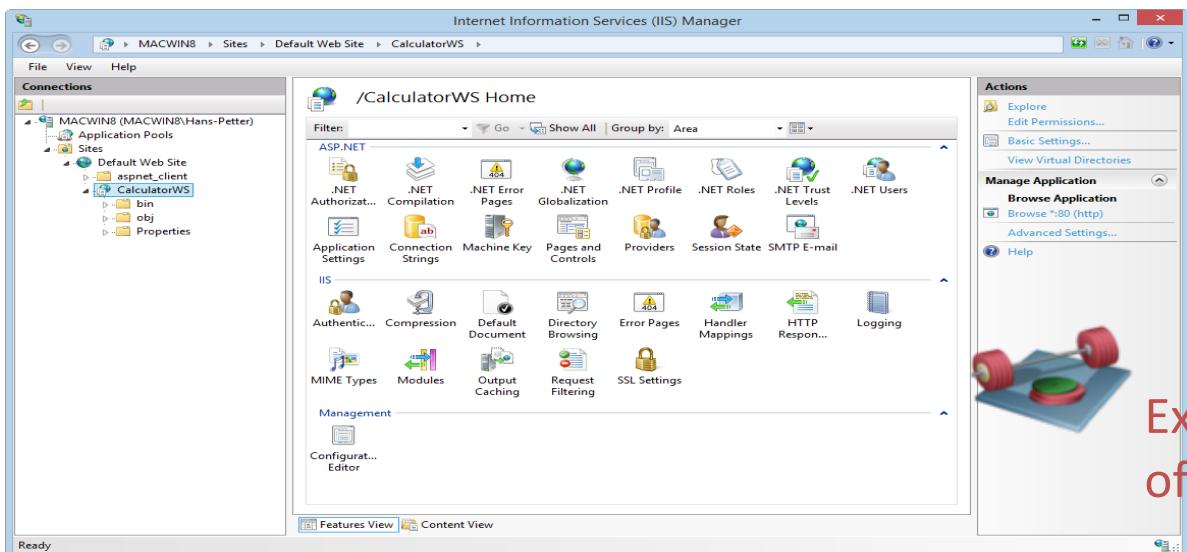

# Web Server Popularity

<http://www.digi.no/921119/under-halvparten-bruker-apache>

# Internet Information Services (IIS)

- IIS – Internet Information Services
- Web Server that host the Web Pages/Web Site
- Make sure to have the IIS installed with ASP.NET sub components

Default IIS Directory:  
**C:\inetpub\wwwroot**

Exercise: Deploy one (or) more  
of your Web pages using IIS

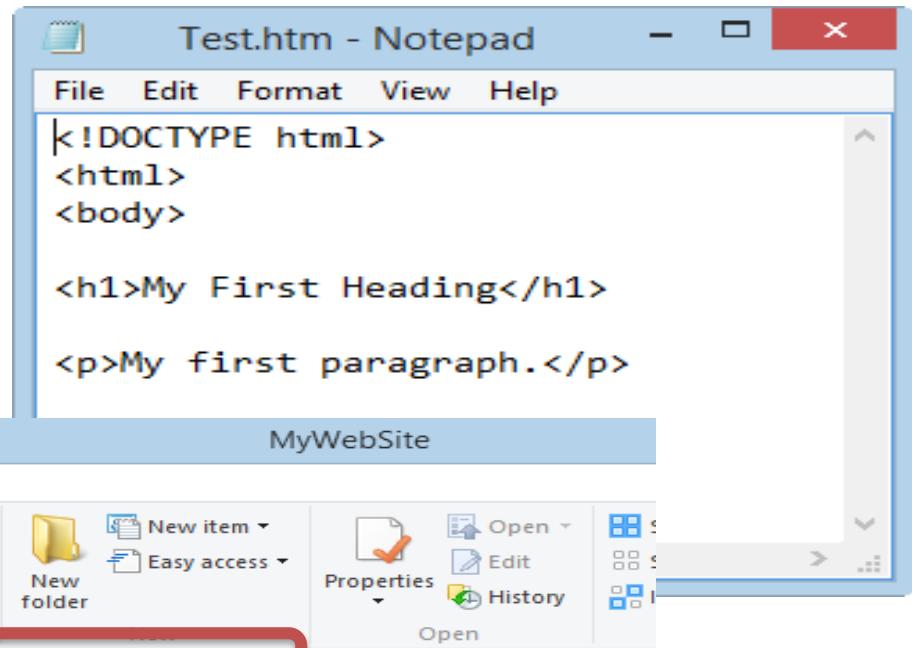

```
<!DOCTYPE html>
<html>
<body>

<h1>My First Heading</h1>

<p>My first paragraph.</p>

</body>
</html>
```

# IIS Deployment

Name	Date modified	Type
Test.htm	2014-11-13 11:23 ...	HTML Doc

# IIS Deployment

The screenshot illustrates the process of deploying a web application using Internet Information Services (IIS) on a Windows server. The main window shows the 'Default Web Site Home' with various configuration options like Compilation, .NET Error Pages, and Machine Key. On the left, the 'Connections' pane lists 'MACWIN8 (MACWIN8\Hans-Petter)' under 'SITES'. A context menu is open over the 'Default Web Site' entry, with 'Add Application...' highlighted. A large blue arrow points from this menu to a 'Add Application' dialog box. The dialog box contains fields for 'Site name: Default Web Site', 'Path: /', 'Alias: MyWebSite' (which is also highlighted with a red box), 'Application pool: DefaultAppPool', 'Physical path: C:\inetpub\wwwroot\MyWebSite' (also highlighted with a red box), and other settings like 'Pass-through authentication' and 'Enable Preload'. The 'OK' button is visible at the bottom right. Below the IIS interface, a web browser window is open to 'localhost'. The address bar shows 'http://localhost/MyWebSite/Test.htm' (also highlighted with a red box). The browser displays the content 'My First Heading' and 'My first paragraph.' A callout bubble on the right side of the browser window says 'Test your Web Page in your Web browser'. Another callout bubble at the bottom left of the browser window contains the text: "'localhost'" is your personal computer, you can also use your IP address.'
